

CANNA Magnesium (Mg07)

CANNA Magnesium is essential for photosynthesis. It is an essential atom in chlorophyll. Furthermore, magnesium influences other pigments and physiological processes. This makes it an essential element in the development of the plant.

CANNA Magnesium can be directly absorbed by the plant and therefore the effects can be seen quite soon. It can be used as a fertiliser for magnesium deficiency and as a supplementary nutrient to stimulate the growth and bloom.

User Instructions

This mineral fertiliser contains 7% MgO and 14% SO₃.

Magnesium is crucial for the photosynthesis process. Furthermore, magnesium has an influence on other pigments and on physiological processes.

Liquid epsom salts (magnesium sulphate) can be immediately absorbed by the plant and produce a fast, visible effect.

Liquid epsom salts in concentrated form cannot be mixed with fertilisers containing calcium.

Application

- To be applied as a magnesium fertiliser, amongst others, in the case of a magnesium deficiency.
- As a supplementary remedy to stimulate the growth and bloom.
- Administer in the nutrient solution or spray the leaves. Dilute 1ml/litre.

Dosage

Dilute 10-20 ml concentrate per 10 litre of water (1:1000/1:500).

Warning

A good fertiliser contains all essential elements in the correct proportions. An overdose of magnesium can result in calcium deficiency. Therefore, proceed with caution when determining the dose; an overdose could be harmful to the plant!
